GPT-5.6

SOL HIGH

EXECUTIVE QUICK START

Select the right prompt. Supply decisive evidence. Bound authority. Validate the artifact. Retain the result.

RELEASE STATUS

The 80-prompt library is structurally verified and approved for controlled pilot use. Production certification remains specific to the organization, configuration, tools, data, and authorization context.

Use this reference with the Final Master Guide and Phase 3 copy-ready prompt library.

1 Seven-step operating sequence

The minimum process for a consequential professional task.

Step	Control	Action
1	Choose the outcome	Select by decision or artifact, not title.
2	Supply evidence	Attach only sources that can change the result.
3	Set boundaries	Define permitted inspection, approval gates, exclusions, and stop conditions.
4	Choose selection	High is the default for complex work; escalate only when evaluated.
5	Run contract	Require evidence, assumptions, exact output, validation, and completion criteria.
6	Verify	Test, render, inspect, recalculate, cite, and confirm tool results.
7	Retain	Save prompt, inputs, configuration, tools, output, score, defects, and decision.

FAST START PROMPT

ROLE: You are the accountable [ROLE].
MISSION: Produce [DECISION OR ARTIFACT].
INPUTS: Use [FILES, CODE, DATA, STANDARDS, CONNECTED SOURCES].
BOUNDARIES: Do not invent facts or access. Require approval for external, destructive, costly, or scope-expanding actions.
RETURN: [SECTIONS, FORMAT, EVIDENCE, TESTS].
COMPLETE ONLY WHEN: Claims are supported, validation is performed or pending is explicit, and unresolved risks are visible.

2 Routing and selection

Start with the lowest evaluated configuration that passes the workload.

Workload	Starting selection	Required control
Routine transformation	Medium or lower	Exact output contract; basic review
Complex professional work	High	Production High prompt; evidence and validation
Architecture or release gate	Extra High	Traceability, tests, alternatives, residual risk
Difficult quality-first decision	Pro after evaluation	Representative trials must justify latency/token tradeoff
Authorized defensive security	High or higher	Mandatory authorization header and expert approval

EFFICIENCY

Compare the working configuration with the same reasoning setting and one level lower on representative tasks. Keep additional reasoning only when it produces a material measured gain.

Workspace readiness

- Confirm model and reasoning selections exposed by the plan or API account.
- Confirm required Skills/plugins are installed and apps are enabled and authenticated.
- Verify underlying source-system permissions; a plugin does not grant new data access.
- Define external-write, production-change, financial, destructive, and security-testing approvals.
- Classify sensitive data and establish retention, incident, and escalation paths.

3 Defensive cybersecurity control

Authorization is evidence, not a phrase added to bypass safeguards.

MANDATORY CYBER HEADER

AUTHORIZED DEFENSIVE CONTEXT
Owner / authority: [ORGANIZATION, OWNER, OR ENGAGEMENT AUTHORITY]
Target / environment: [NAMED CODEBASE, APPLICATION, TENANT, CLOUD ACCOUNT, LAB, OR PRODUCTION SCOPE]
Permitted actions: [REVIEW, ANALYZE, PATCH, TEST IN AUTHORIZED ENVIRONMENT, DOCUMENT]
Out of scope: [EXCLUDED SYSTEMS, DATA, TECHNIQUES, OR ACTIONS]
Stop condition: [WHEN TO PAUSE OR ESCALATE]
Evidence handling: [RETENTION, PRIVACY, DISCLOSURE]
Defensive outcome: [PATCH, DETECTION, HARDENING, TRIAGE, RECOVERY, OR RISK DECISION]

Acceptance before completion

- Material claims cite evidence or are labeled as assumptions.
- The requested artifact or decision is complete and usable.
- Tests, renders, formula recalculation, citations, or tool confirmations are performed as applicable.
- External actions and production changes receive the required human approval.
- Cyber work remains inside the named target, permitted actions, safe environment, and stop conditions.
- Unresolved risks, residual risk, and pending validation are visible.

FINAL RULE

A polished response is not proof. Completion requires evidence, artifact-native validation, and accountable human ownership of material action.
